Simply search for Mimivirus using one of the excellent search engines, such as Google.com. The mimivirus genome contains 1.2 million bases, more than many bacteria. The bases represent 1,260 genes, making it as complex as some bacteria. Most viruses use DNA or RNA to transport their " information, but mimivirus has both nucleic acids. In addition, mimimivirus can make approximately 150 of its own proteins and can even repair its own DNA if given. Normal viruses are not capable of prosthetic synthesis or DNA repair " on their own, they must rely on the null organizations of their helper cells for these activities. It remains to be seen whether mimivirus should be placed in an existing domain (superkingdom) or in its own domain. For more information" see Dr. Raoult, et al. "The 1.2 MB mimivirus genome sequence." Science publicªÀ Online, DOI: 10.1126/Science.1101485 (2004); B. La Scola et al. "A giant virus in the amoebas." Science 299 (5615): 2033 (2003). See the three domains of life. Some scientists have speculated that the evolution " eukaryotic cells implicªÀ the fusiÀ " n of two or more genomes, a less " phenomenon called symbiosis. Eukaryotic cells are characterized by the presence of membrane-bound orgª ules, including chloroplasts, mitochondria, and nuclei. The origin of a complex classroom has intrigued scientists for decades, and has been a hotly debated topic between evolutionists and creationists. According to " endosimbiont thesis, bacteria can be the progenitors of cellular organelles such as chloroplasts and mitochondria. A primitive nucleus (protonNucleus) may have evolved from an intracellular virus; However, one weakness of this " thesis is that viruses generally lack some of the key genes found in eukaryotes. The complex genome mimivirus includes these genes, which supports the evolution " a protoAcle of a virus. See symbiosis and hipªÀ " thesis of endosimbiont The topical viruses are not suriv sol ,sonamuh sol nÈ .seva y sorefªAmam ne sedademrefne nasuac surivanoroc sol .eadivivanoroc U ailimaf al arap nªAmoc erbmom le se surivanoroc le se }0202 ed ozzram 2 le odatlusnoc(aideipikiW ed se negami e nªÅicamrofni etneugis aL .al .soviv sametisis sol ed nªÅiculove al ne selbaton y sojelpmoc siÀm sorgol sol ed sonugla ,salul©Åc rop sadaidem semumi satesepuser y opreucitna elbªAercni us ne railnoc nebed sonamuh sol. ametisis us a odasergni ayah euq zev anu rosvni la ranimile y opreuc us etnemadipªÀr raenacse arap o ,laicnetop nªÅiccefi anu ed olratrela arap etnediser surivlna amargorp nu etsike on sonamuh sol ne .etnemadanutrofasoD .socitªÀmrofni suriv sol a seralimis etnemelbaton nos lauxes nªÅicaquinoe al ed s©Åvart a anosrep a anosrep ed netimsart es euq }HIV le omoc(socim©Ådipe suriv sol. }HIV led suriv selaroproce sodiluf o jeria le ne suriv(eria led s©Åvart a rasropsid nedeup es sosiocefini sonamuh suriv sol. .satnal y selamina racata nedeup suriv sol. .seralucelomorcam salucªAtrap sominªAm omoc riviverbos nedeup suriv sol ,deps©Åuh salul©Åc sus ed areuf .sanÅetorp ed sisetnªAs al y NDA led nªÅicacilper al ed s©Åvart a suriv siÀm ricudorp a nagilbo al y deps©Åuh alul©Åc al nartseuces suriv sol .surivanoroc ed nªÅiriv nu ed nªÅicartsuli atse nÈ .ralos anoroc o anoroc anu a adreuer euq negami anu odnaerc asoblub ecicifrepus ed senoiceyorp sednarg ed ajnarf anu neneit euq .acinªArtelece aªPocscrcim rop }deps©Åuh alul©Åc anu ed areuf suriv led asioceefni amrof al(senoiriv sol ed acitsªAretecarac acineirapa al a aicenerifer ecah erbmom IE .olah o anoroc acifingis euq .anoroc nªAtal led avired "surivanoroc" erbmom IE .ladiocileh aÅrtemis ed edispiªÅcoelcun nu y oiranetaconom NRA ed amoneg nu noc solteuvne suriv noS .onamuh surivanoroc le rop senioceefni sal ratart o rineverp arap selarivitna sotnemacidem in sanucav netsixe oN .aerraid nasuac surivanoroc sol sodroc y savac ne Highly magnified (2000x) of the human pus that shows white glasses (called neutrófiles) with deeply lobed pªÀrpuras. Microscope image of human sperm in semen (1000x). The illustration insert shows the acrosome, head and middle piece of a human spermatozoan. 5. A baseball-sized puffball (Calvatia gigantea) in San Diego County, California. The inside is filled with a dark mass of spores intermingled with threadlike hyphae (capillitium). The close-up view of spores (right) was taken at 1,000x. Each spherical spore has a diameter of about 1/200 mm (5 µpªAm), slightly smaller than a human red blood cell (7.5 µpªAm). Depending on the species, puffballs range in size from a baseball to a basketball. When they are mature, the puffball releases millions of spores into the air in a cloud of black dust. This can easily be demonstrated if you accidentally kick one. According to David Arora (Mushrooms Demystified, 1996), a large puffball may contain 7 trillion spores. Lined up single file, this number of spores would extend around the earth's equator. If each spore produced a puffball the size of a basketball, the resulting puffballs would extend from the earth to the sun and back! 6. Lichens are a symbiotic relationship between algae and fungi. The main body of a lichen is composed of fungal tissue (usually class Ascomycota) with photosynthetic algal cells (usually division Chlorophyta) embedded within this fungal mass (mycelium). The spores are produced by the fungal component or mycobiont, usually in a cup-shaped body called an ascocar. Lichen spores can be 1-2 micrometers in Acarospora chlorophana, or up to 40 micrometers long in Diploschistes scruposus (left). The size, color and shape of spores are useful traits in separating different species of lichens. Spores up to 40 micrometers or longer are considered large. 7. The width (diameter) of a human hair ranges from very fine (0.017 mm) to very coarse (0.181 mm). The right image shows a fine human hair at 1,000 x magnification. The hair width is 0.070 mm or 70 micrometers. With the unaided individual hair stem is visible when placed on a sheet of white paper. 8a. A simple proof for the power of resolution of the human eye without help: A. Two fine human hairs are placed 70 microMeters away. Each hair has approximately 70 microstters wide (diameter). With 20-20 vision, it should be able to differentiate between the two hairs at the right focal distance. B. When they are placed closest to each other (about 15 microstters away), the two hairs seem to mix and cannot be differentiated with the simple fact of doing. A manual lens or a magnifying glass is necessary to differentiate between the two hairs. Although hairs can be seen on a white background, they cannot be resolved if they are placed together. The minimum resolution for a computer monitor is 72 points per square inch (DPI), otherwise, the image is pixelated. Printed photos are also composed of points patterns. Above 150 PPP, the points are usually mixed and cannot be resolved. Under a manual lens or microscope, the points can be observed easily. 8b: "Floteros in the eye" Bynharvey E.
